PROCESS IMPROVEMENT AND AUTOMATION

ProcessIQ

From process map to an action plan that sticks

A web app that maps a process, finds delays and waste, identifies what to automate, and tracks that improvements last.

Jason Mosley · Fictional sample data shown

Why process improvement often falls short

Four gaps that ProcessIQ is built to close.

1

The map stays on the wall

Workshops produce a diagram, not decisions about what to change.

2

Opinions replace evidence

Nobody measures where the time actually goes, so the loudest view wins.

3

Automation comes too soon

Tools get bought before the process is understood, and automate the waste.

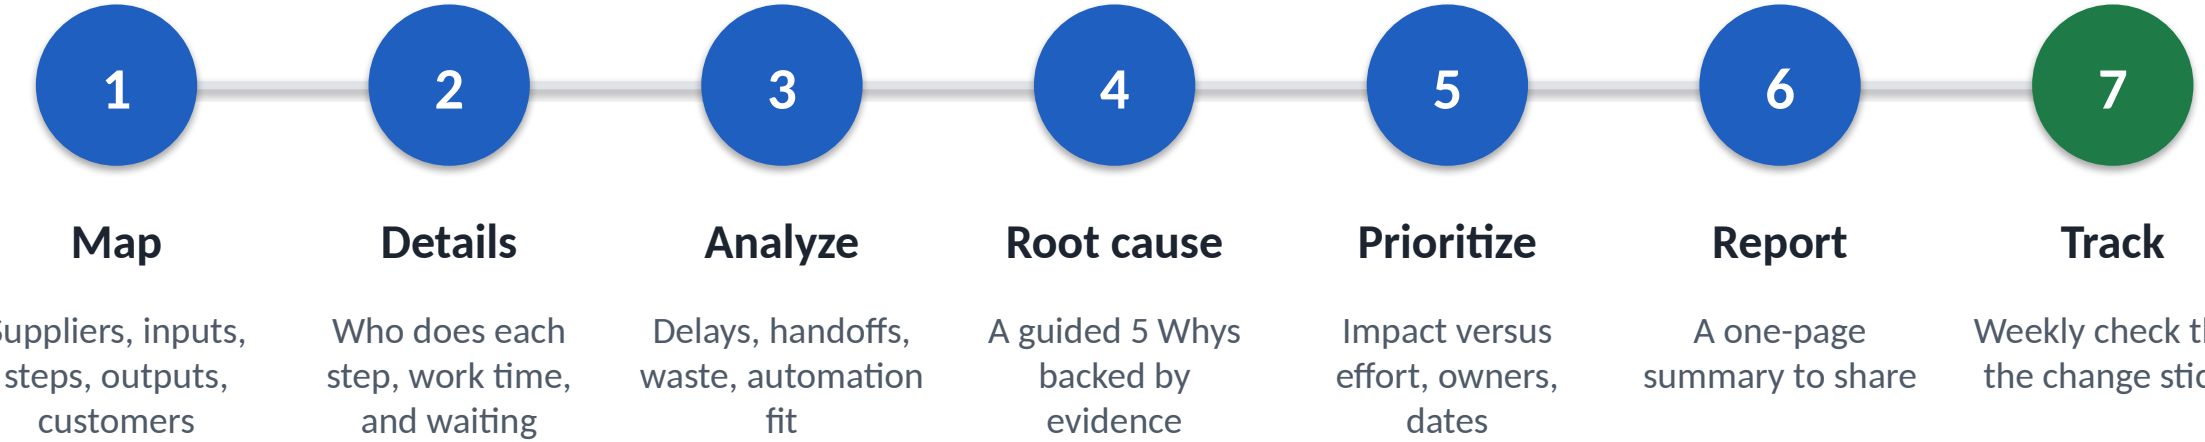

4

Changes fade

Nobody checks whether the new way of working sticks after launch.

One path from map to lasting change

The app shows where you are on the path, and what needs attention next.

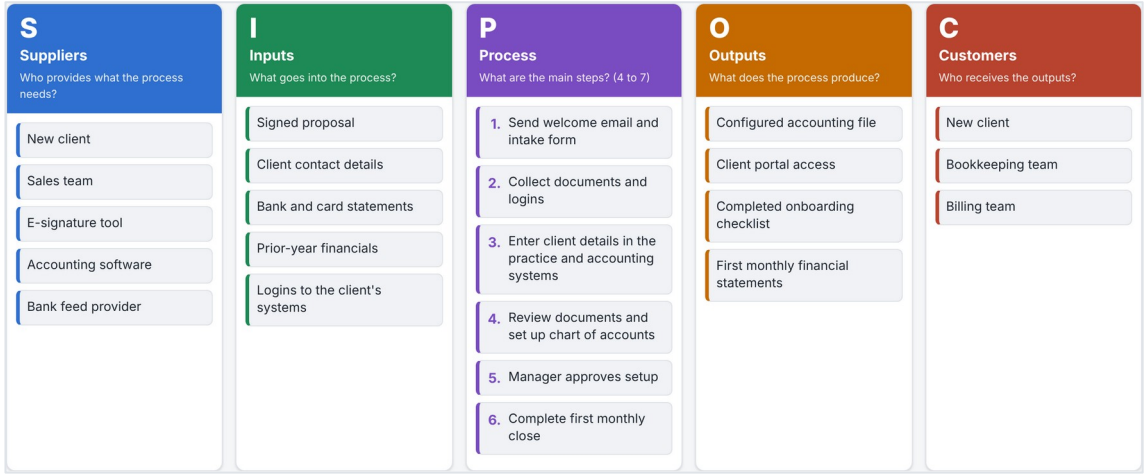

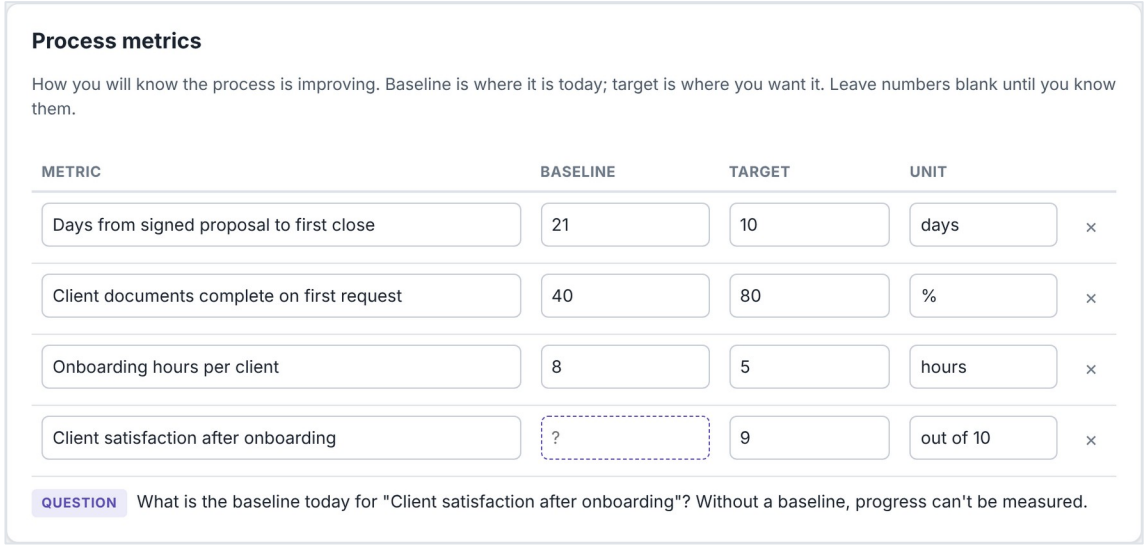

Step 7 runs in my AI Adoption Follow-Through Tracker: approved actions export from ProcessIQ and are checked every week until the new behavior is routine.

Map the process on one page

A SIPOC map shows who supplies what, the main steps, and who receives the results.

- **Clear scope**
  Where the process starts and where it ends
- **Metrics that define success**
  Each with a baseline today and a target
- **Unknowns become questions**
  Blank values are asked about, never guessed

Every finding is labeled, so you know what to trust

ProcessIQ calculates where time goes and flags likely bottlenecks, handoffs, duplication and waste.

FACT

Calculated from what you entered

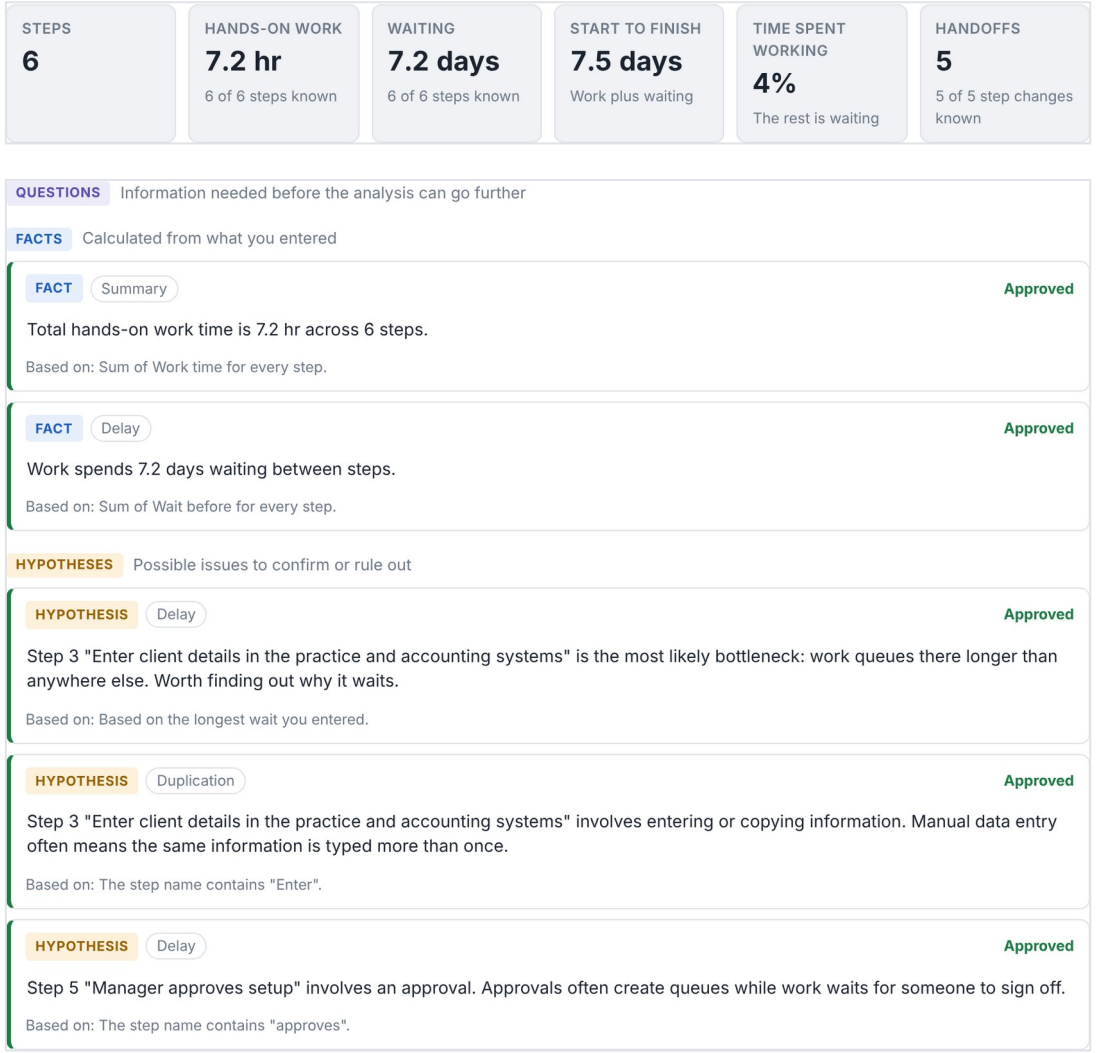

HYPOTHESIS

A possible issue to check first

QUESTION

Missing information: it asks

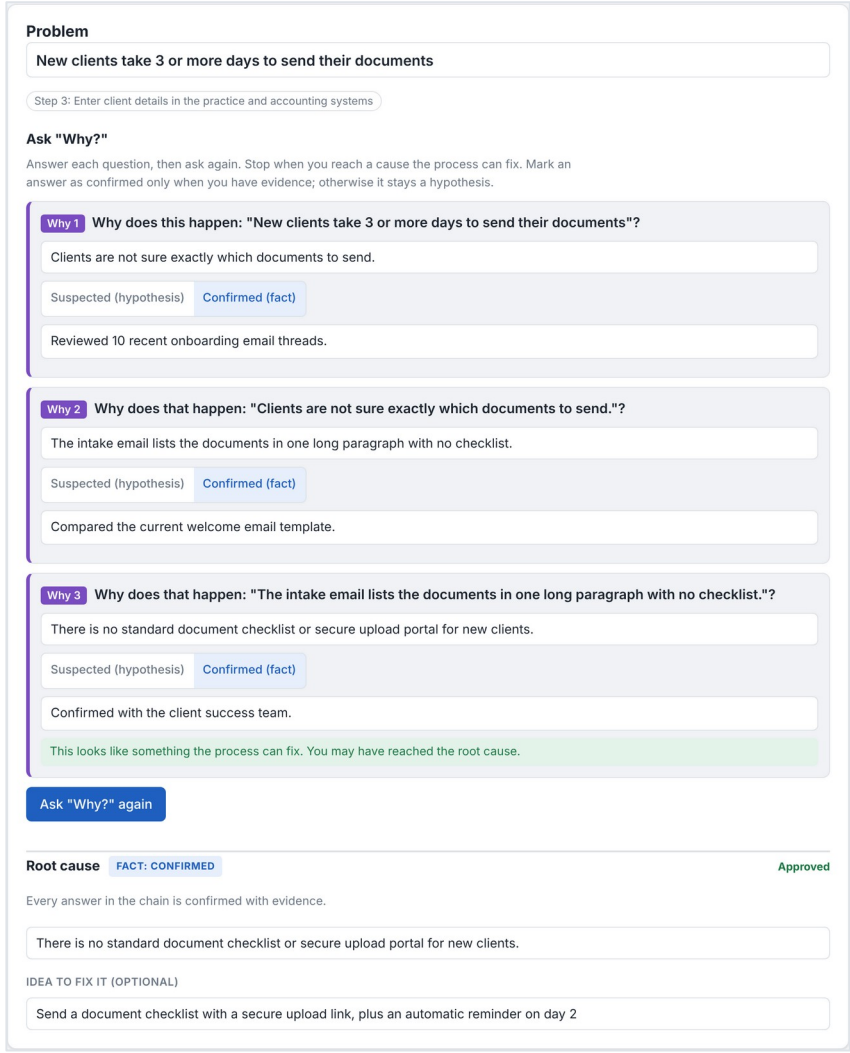

Nothing moves forward until a person approves it.

Get to the root cause with evidence

Each answer is marked suspected or confirmed, with how you know it.

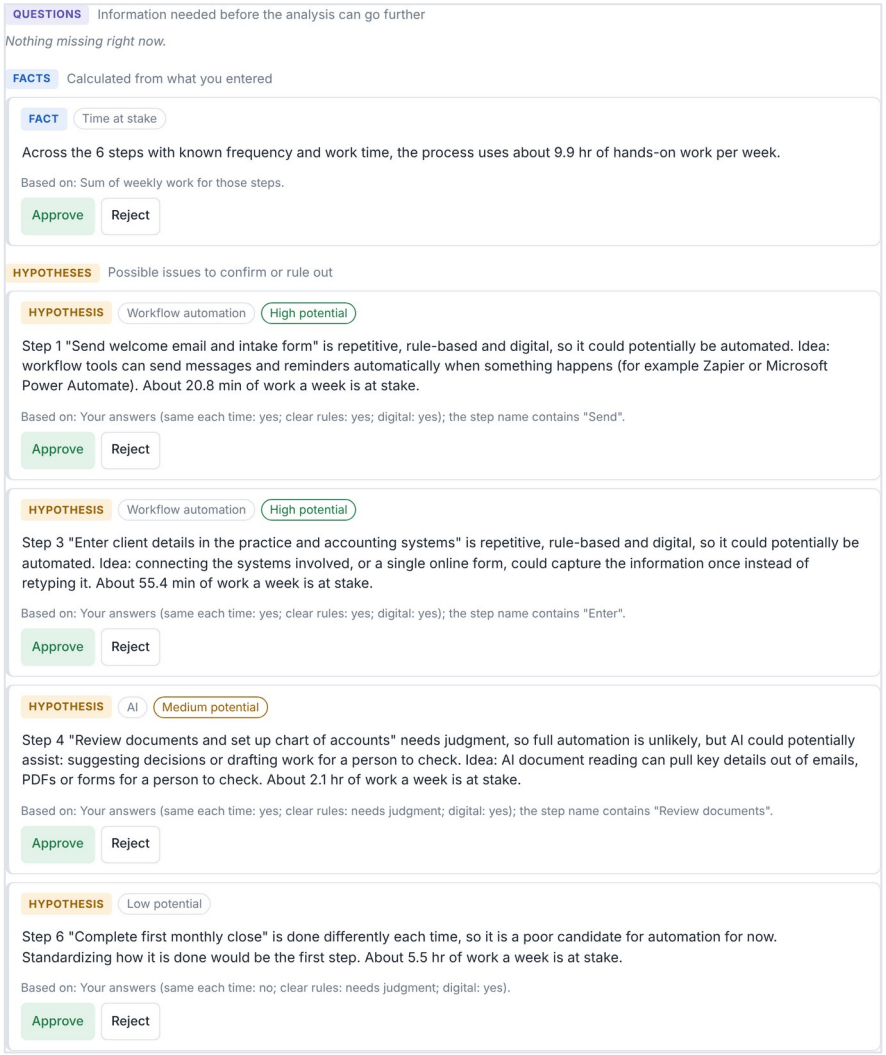

- **Problem**
  Clients took 3+ days to send their documents
- **Root cause, confirmed**
  No standard document checklist or upload portal
- **Fix**
  A checklist with a secure upload link and a day-2 reminder
- **Coaching built in**
  Warns on blame and vague answers

Find what to automate, and what not to

Four plain questions per step, then a potential level and the right kind of fix.

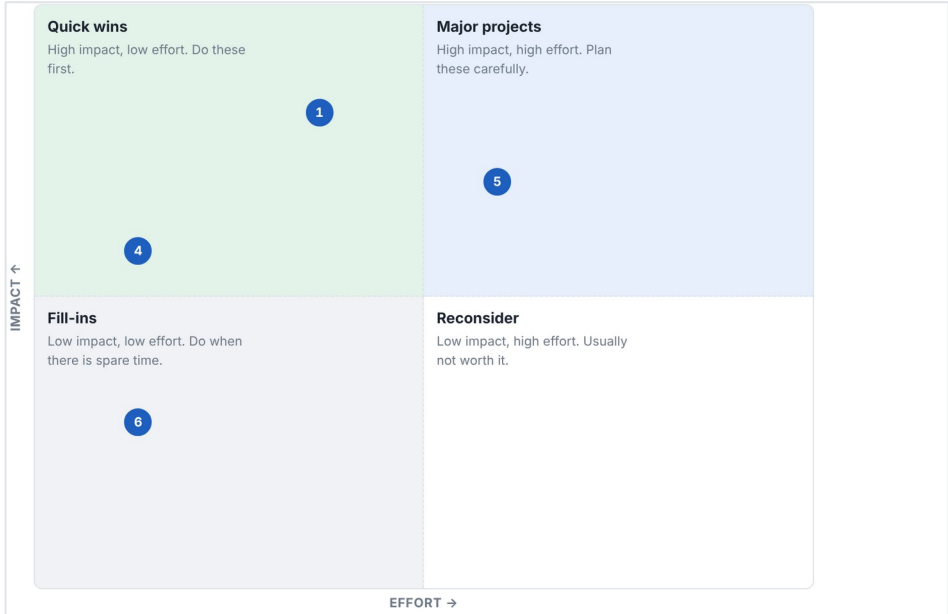

- **Hours at stake**
  9.9 hours of hands-on work a week, step by step
- **3 high-potential steps**
  Workflow automation or existing software
- **AI where judgment is needed**
  Assists a person rather than replacing them
- **1 poor fit, said plainly**
  Before any money is spent

Decide what to fix first

Improvements are rated for impact and effort, then ordered into a plan.

- **Quick wins first**
  High impact, low effort
- **Owners and target dates**
  On every approved action
- **Measures that matter**
  Baseline to target, from the process metrics
- **A one-page report**
  Ready to share with the team

Numbers match the improvement list. Filled circles are approved for the action plan; outlined ones are still to review. A rating of 3 or more counts as high.

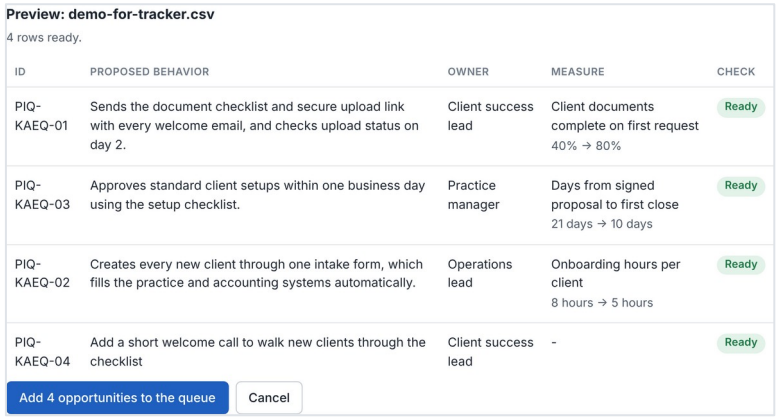

ORDER	ACTION	TYPE	IMPACT	EFFORT	OWNER	TARGET DATE
1	1 Send a document checklist with a secure upload link, plus an automatic reminder on day 2	Quick wins	5	2	Client success lead	2026-12-04
2	4 Speed up or simplify the approval in Step 5 "Manager approves setup"	Quick wins	3	1	Practice manager	2026-11-27
3	5 Automate Step 3 "Enter client details in the practice and accounting systems" with a workflow tool	Major projects	4	3	Operations lead	2027-01-15
4	6 Add a short welcome call to walk new clients through the checklist	Fill-ins	2	1	Client success lead	2026-12-18

Recommended order, based on your ratings: Quick wins first, then Major projects, Fill-ins and Reconsider. Within each group, higher impact and lower effort come first.

Make sure the change sticks

Approved actions flow into the AI Adoption Follow-Through Tracker.

- **One click to export**
  In the tracker's own import format
- **Permanent IDs**
  Importing again never duplicates
- **Measures carry over**
  For example 40% to 80% complete on first request
- **Weekly check-ins**
  Until the new behavior is routine

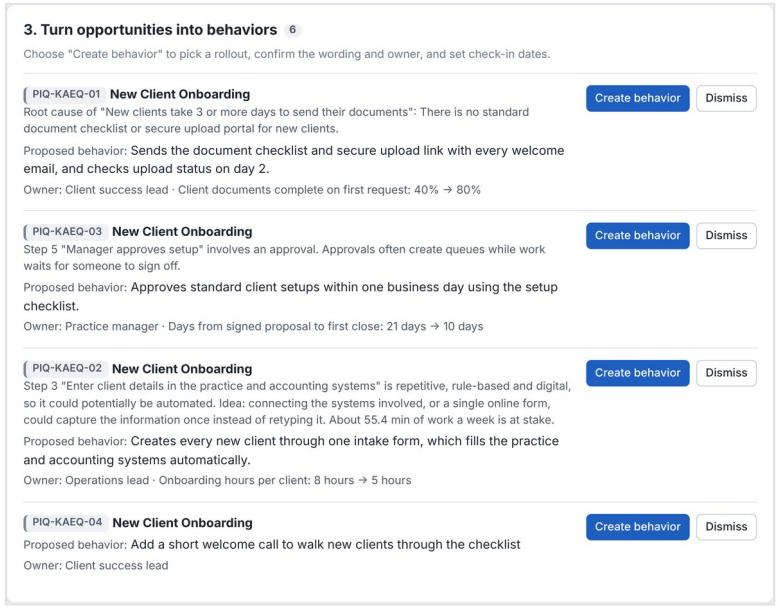

Preview: demo-for-tracker.csv

4 rows ready.

ID	PROPOSED BEHAVIOR	OWNER	MEASURE	CHECK
PIQ-KAEQ-01	Sends the document checklist and secure upload link with every welcome email, and checks upload status on day 2.	Client success lead	Client documents complete on first request 40% → 80%	Ready
PIQ-KAEQ-03	Approves standard client setups within one business day using the setup checklist.	Practice manager	Days from signed proposal to first close 21 days → 10 days	Ready
PIQ-KAEQ-02	Creates every new client through one intake form, which fills the practice and accounting systems automatically.	Operations lead	Onboarding hours per client 8 hours → 5 hours	Ready
PIQ-KAEQ-04	Add a short welcome call to walk new clients through the checklist	Client success lead	-	Ready

Add 4 opportunities to the queue | Cancel

3. Turn opportunities into behaviors 6

Choose "Create behavior" to pick a rollout, confirm the wording and owner, and set check-in dates.

PIQ-KAEQ-01 **New Client Onboarding** — Create behavior | Dismiss

Root cause of "New clients take 3 or more days to send their documents": There is no standard document checklist or secure upload portal for new clients.

Proposed behavior: Sends the document checklist and secure upload link with every welcome email, and checks upload status on day 2.

Owner: Client success lead · Client documents complete on first request: 40% → 80%

PIQ-KAEQ-03 **New Client Onboarding** — Create behavior | Dismiss

Step 5 "Manager approves setup" involves an approval. Approvals often create queues while work waits for someone to sign off.

Proposed behavior: Approves standard client setups within one business day using the setup checklist.

Owner: Practice manager · Days from signed proposal to first close: 21 days → 10 days

PIQ-KAEQ-02 **New Client Onboarding** — Create behavior | Dismiss

Step 3 "Enter client details in the practice and accounting systems" is repetitive, rule-based and digital, so it could potentially be automated. Idea: connecting the systems involved, or a single online form, could capture the information once instead of retyping it. About 55.4 min of work a week is at stake.

Proposed behavior: Creates every new client through one intake form, which fills the practice and accounting systems automatically.

Owner: Operations lead · Onboarding hours per client: 8 hours → 5 hours

PIQ-KAEQ-04 **New Client Onboarding** — Create behavior | Dismiss

Proposed behavior: Add a short welcome call to walk new clients through the checklist

Owner: Client success lead

What the sample analysis surfaced

Fictional sample: new client onboarding at Northwind Bookkeeping.

96%

of onboarding time was waiting, not work

9.9 hr

of hands-on work a week, measured step by step

1

root cause, confirmed with evidence

4

actions with owners, dates and measures

The takeaway: speeding up the work would barely help. Cutting the waiting, starting with a document checklist and upload link, is where the time is.

Built to be trusted

?

Asks, never guesses

Missing information becomes a question, not an assumption.

Nothing approved for you

Every finding, root cause and action needs a person's decision.

Private by design

Your processes stay in your own account and sync across your devices.

AI

AI that's labeled

Optional Claude suggestions are marked and stay hypotheses until approved.

How a project could run

1

Discover

Map the process with the people who do the work, and set the metrics that matter.

2

Analyze

Measure where time goes, confirm root causes, and assess what to automate.

3

Plan

Agree on prioritized actions with owners, dates and measures.

4

Sustain

Track adoption weekly until the new way of working is routine.

Every stage runs in ProcessIQ, so the map, the evidence, the decisions and the follow-through stay in one place.

Let's find what's slowing your process down

Process mapping, root cause analysis, automation assessment, and adoption tracking, in one connected method.
